

# MICRODERMABRASION

## MICRODERMABRASION

A good cure should always start by a good cleansing of the skin. It's the secret for a radiant look. Without exfoliation, dead keratinized cells that accumulate on skin can't be eliminated. They create a barrier and have a waterproof effect on skin, leaving the active ingredients of cosmetic products "sleeping" on the surface of the skin.

The **VitaPeel Ion™** microdermabrasion device is the ideal choice to solve this problem. By eliminating dead cells and superficial layers of the epidermis, the VitaPeel stimulates the renewal of skin cells and the production of collagen in the dermis. This top of the range microdermabrasion device is powerful enough to visibly reduce wrinkles, superficial pigmentation spots, scars and stretch marks.

The VitaPeel stands out from the competition thanks to several exclusive functions but, also because of its unique working technique in three steps.

First, the aspiration-vacuum mode activates microcirculation, oxygenates tissues and plumps wrinkles and expression lines for a younger appearance. This mode has an instant effect on the skin tone and prepares skin for micro-dermabrasion. Then, thanks to its 60 adjustments levels, two engines and dual pump, the microdermabrasion mode enables us to exfoliate efficiently and adapt to all skin types and imperfections. The performance of the machine is an important criteria in microdermabrasion since it's what gives visible results. Finally, its Ion mode enables us to give different types of post-microdermabrasion care: transcutaneous infusion of products, stimulomassage, light therapy, infrared cure, etc. Following a microdermarasion treatment, these functions all have the effect of relieving redness, restoring the pH level, stimulating rejuvenation and accelerating the effect of care products by forcing their penetration.

In short, the treatment with this machine can really improve the general appearance of all skin types. It's also one of the most effective ways to reduce the appearance of wrinkles and pigment spots, improve dehydration problems and slow down the aging process.
